

Module 0: Introduction

Basics of supply-side health and this class

Ian McCarthy | Emory University Econ 372

Health and Health Care

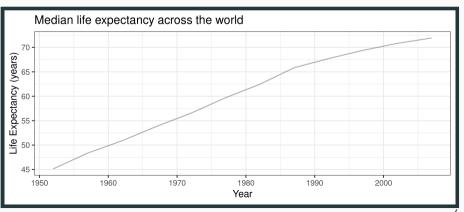

Health and Health Care

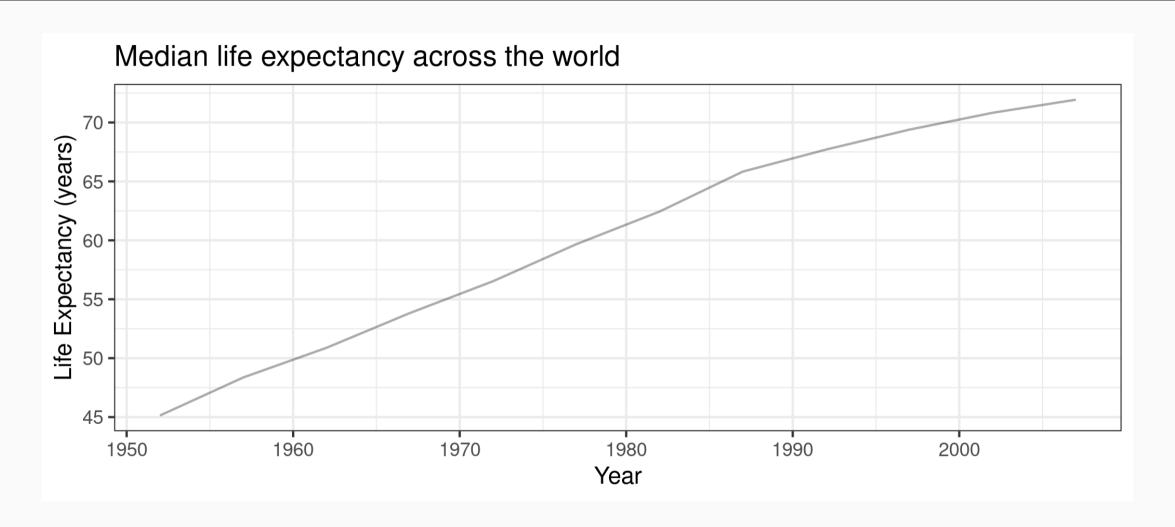

We've made *major* improvements in life expectancy (and many other measures of health) across the world

- Poverty reduction
- Technology development and innovation
- Technology diffusion and adoption
- Access to better services, including health care

Evidence of better health

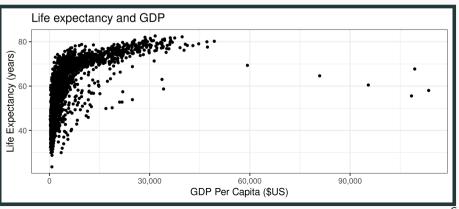

Evidence of better health

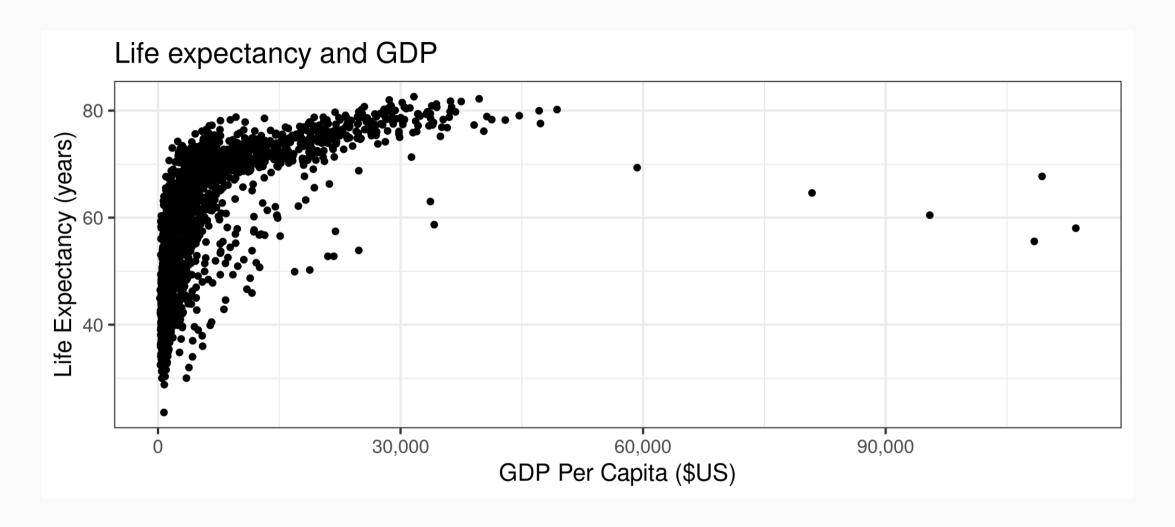

GDP and Health

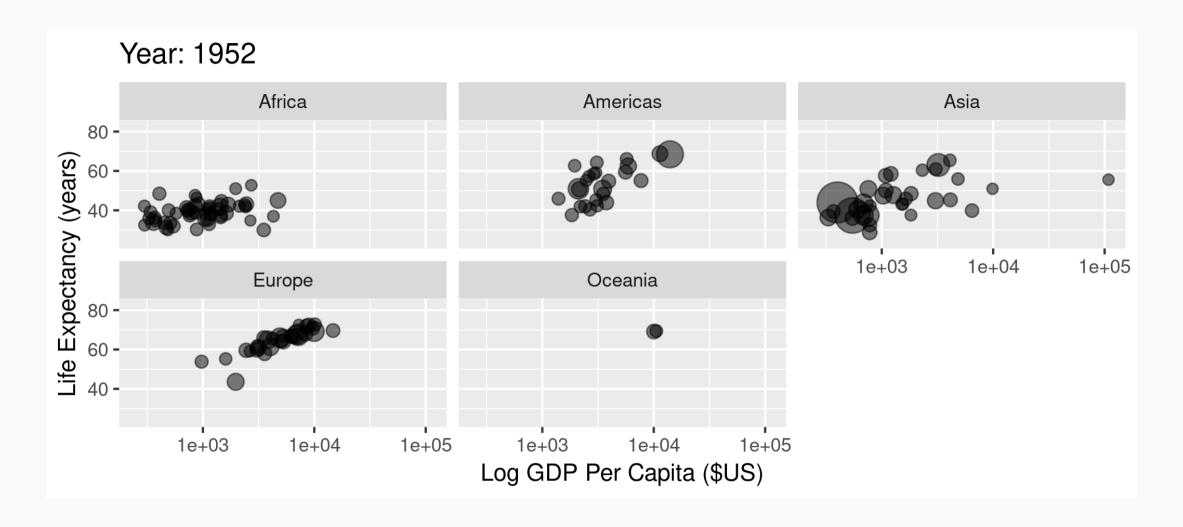

```
library(gapminder)
ggplot(data = gapminder, mapping = aes(x = gdpPercap, y = lifeExp)) +
    geom_point(size = 1) + theme_bw() + scale_x_continuous(label = comma) +
    labs(x = "GDP Per Capita ($US)",
        y = "Life Expectancy (years)",
        title = "Life expectancy and GDP")
```

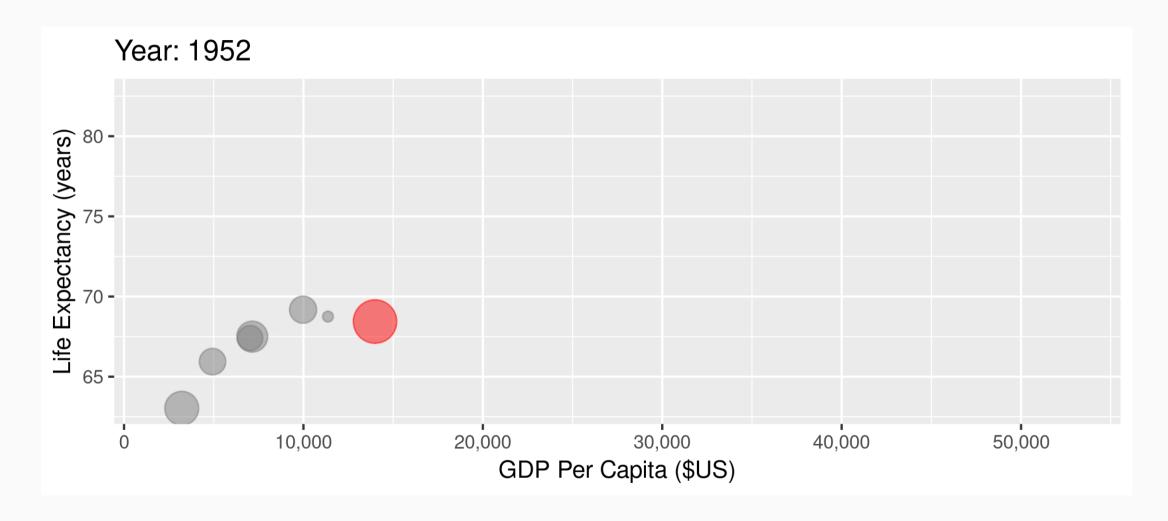

GDP and Health

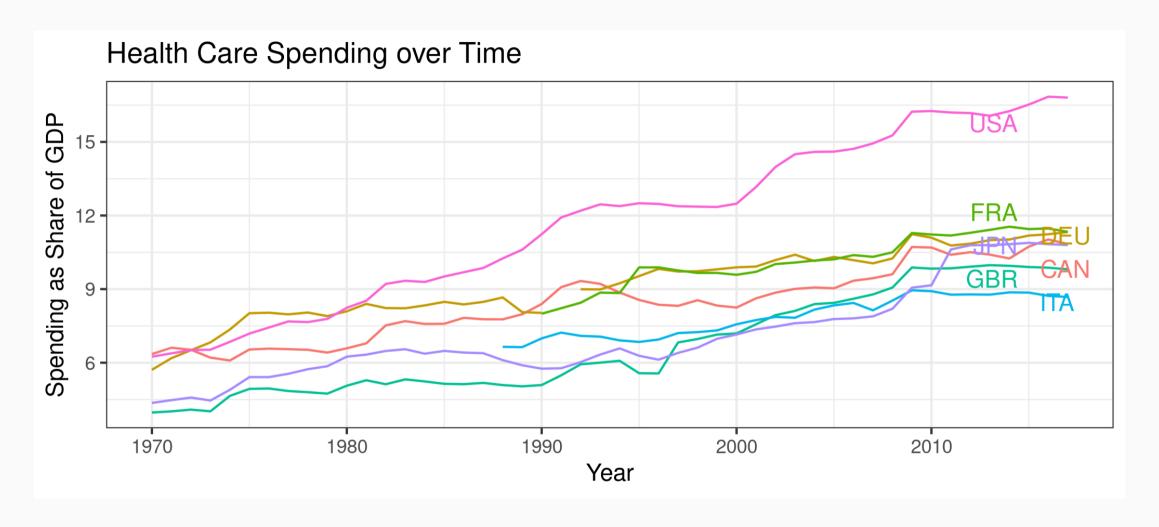

GDP and Health over Time

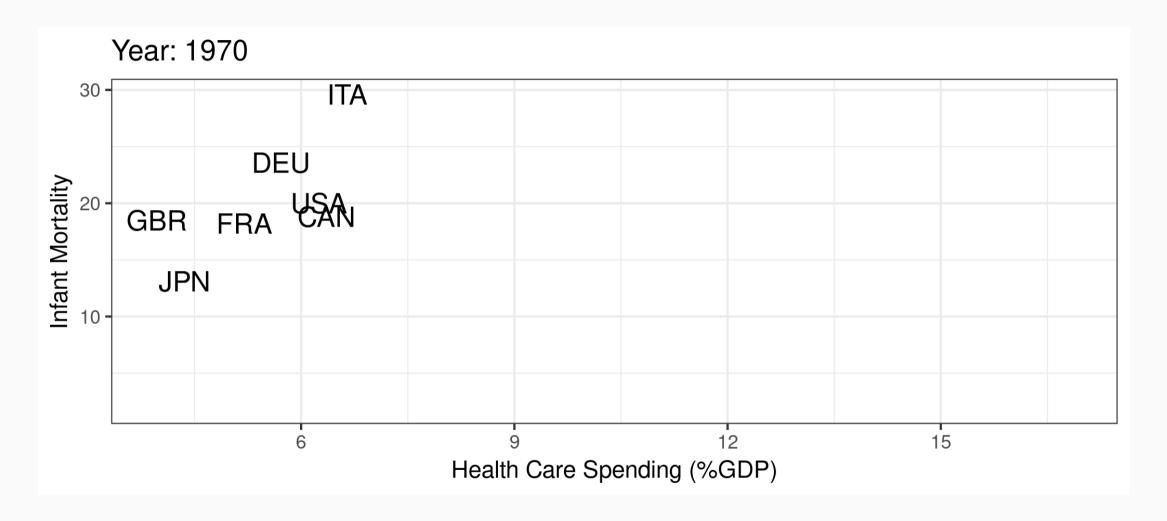

But the US is unique

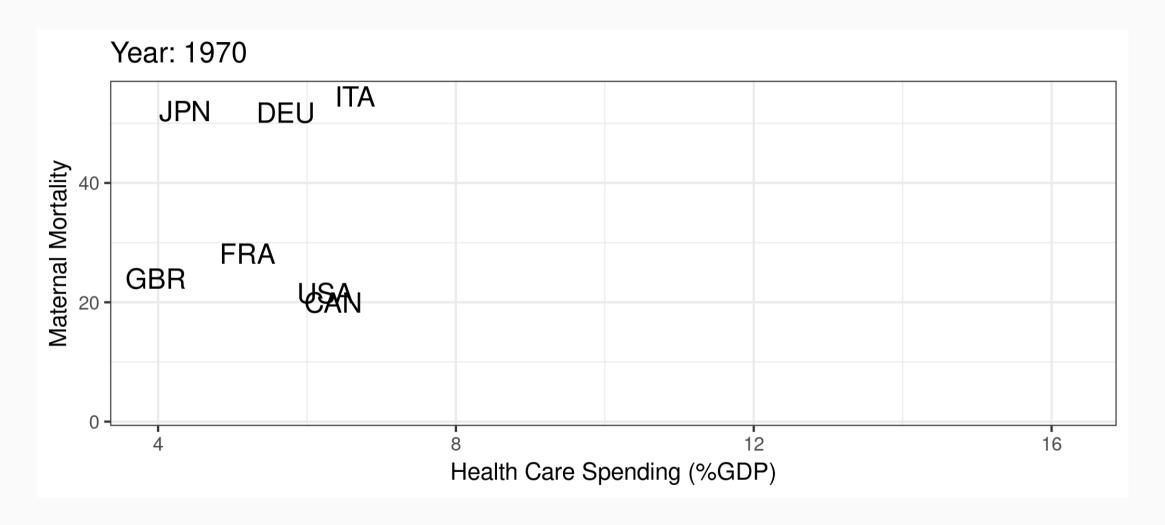

Health care spending

Spending and infant mortality

Spending and maternal mortality

What does that mean?

- Are we just woefully inefficient?
- The right answer is probably more complicated
 - U.S. very good in some areas (breast cancer treatment, interventional cardiology)
 - Let's look at some more graphs from the Commonwealth Fund

Why study U.S. health care

- 1. Health and health care are constantly changing
- 2. Health expenditures in 2019: \$3.8 trillion, 17.7% of GDP, \$11,582 per person (from NHE Fact Sheet)
- 3. U.S. health care is uniquely inefficient in many ways

"Nobody knew health care could be so complicated"

-- Donald Trump

Health Care and Economics (in General)

Lots of interesting economic issues in health care (not all unique to the U.S.):

- 1. Extremely heterogeneous products
- 2. Asymmetric information between patients and physicians
- 3. Unobservable quality (experience good)
- 4. Unpredictable need (inability to shop in many cases)
- 5. Distortion of incentives due to insurance
- 6. Adverse selection (asymmetric information between patients and insurers)

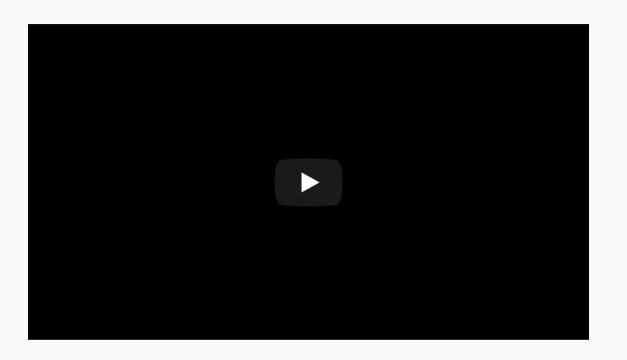

How is the U.S. unique

- These factors exist in other markets and in other countries, but...
- Health care is unique in the combination of these issues
- U.S. is unique in the extent of these issues in health care (policy problems)

Why?

Can you identify one or two reasons for our high prices/expenditures? Keep in mind we don't have a particularly strong quality advantage either.

Why is spending so high?

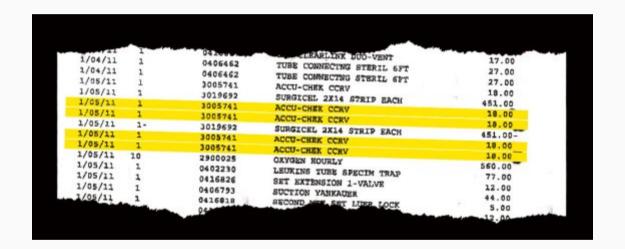

Fragmentation

A common criticism of U.S. health care is that it is extremely fragmented:

- different ways to get insurance
- mix of providers and reliance on referrals
- separate billing (for the most part)

Complicated bills

Our fragmented system has led to a ridiculously complex and convoluted billing process

Brill, Steven. 2013. "Bitter Pill: Why Medical Bills are Killing Us." *Time Magazine*.

Complicated bills

- \$18 for accu-chek test strip (in 2011)
- Can get 50 for \$11.44 on Amazon

Note: this \$18 is a charge, which is different from price or cost...much more on this later

What did we learn?

- 1. We spend LOTS on health care, the most in the world by far
- 2. Definitely not the highest quality health care system in the world
- 3. Many reasons:
 - Standard health economics issues
 - Fragmented system
 - Market-based system but without real competition
 - Policy failures
- 4. What's the solution?

Take this class!!

"What" and "How"

Now, let's go into more detail on "what" specifically we'll try to learn this semester, and "how" we'll try to learn it.

Goals of this course

- 1. Explain the structure of the U.S. health care system, its main components, and its history
- 2. Model adverse selection in health insurance, examine its effects on health insurance markets, and support your arguments with existing data
- 3. Explain the physician agency problem, use a model of physician agency to examine financial incentives in health care, and summarize empirical evidence on the presence of physician agency
- 4. Describe hospital pricing, negotiation with insurers, and explain (qualitatively and quantitatively) the differences between charges and prices
- 5. Analyze hospital data in a real-life setting and predict effects of real-life policies

Structure

Course designed to follow someone through our health care system.

- 1. Choose an insurance plan (so we'll study insurance and insurance markets)
- 2. Select a physician (so we'll study physician agency and financial incentives)
- 3. Receive hospital care (so we'll study hospital behaviors, pricing, and competition)

Materials

- Check the website!
- I'll reference a couple of textbooks, but they aren't required
- All readings and supplemental materials listed on the content page of our class website

Assignments

Assessment in 4 different ways:

- 1. Homework (3 assignments, 1 for each module)
- 2. Mid-term exam (covers modules 1-2)
- 3. Project (relates mainly to module 3 but is semester long)
- 4. Participation

Grading

Component	Points	Weight
Homework (x3)	180	45%
Mid-term	60	15%
Project	140	35%
Participation	20	5%

Office hours

- Official office hours are Monday and Wednesday, 2:30 to 3:30
- PAIS 573, but Zoom is an option
- **Unofficial** office hours (nearly) anytime!
- Just book a time on my appointments page on our website

Contact me

- Drop by during office hours
- Schedule a quick chat
- Email (usually respond within 24 hours)
- Happy to grab a coffee and meet in person

Expectations

- This is an **economics** class first
- Need some calculus to think things through formally
 - Nothing more than derivatives
 - o For review, see the practice problems on the class resources page
 - If you can do those reviews, you're in good shape
- This is a challenging class, but we will do it and we'll learn a lot along the way!
